Test Incident Report

Summary

Incident Report #: 1
Test Case #: 12
Description: System fails to prevent the checkout of a book that is already on an active loan.
Severity Level Code (1-Critical, 2-High, 3-Medium, 4-Low): 1 (Critical)
Impact Level Code (1-Critical, 2-High, 3-Medium, 4-Low): 2 (High)

Identification

Date: March 11, 2026
Tester: Farhan
Product being tested: Library Information Management System (LIMS)
Software version: Iteration One
Hardware Configuration: Windows PC, XAMPP Local Environment, 8GB RAM, 1 TB SSD

Details

Expected and Actual Outcome: Expected the system to block the transaction and display a red error message: "Book is not available or there was an error". Actually, saw the System accept the data and create a second "Active" loan for the same book ID in the database.
Actions: 1. Log into the system as a Staff/Admin user. 2. Navigate to the "Loans" menu and select "Checkout Book". 3. From the dropdown, select a book that is already currently out on loan (e.g., "The Pragmatic Programmer"). 4. Select a client and a future due date, then click "Confirm Checkout".
Data Used: Book ID: 2, Client ID: 1, Due Date: 2026-03-25.

Related Test Case(s): 12

Resolution

Comments/Suggested Solution: Although the `LoanModel.php` contains a `checkBookAvailability` method, the simulation suggests the `LoanController.php` did not correctly handle the `false` return value. Ensure the controller's conditional logic strictly prevents the database insert if the availability check fails.
